Operations on butane and propane: easily adaptable to European butane and propane gas bottles and different types of automatic changeover regulators

Remote alarm telemetry system for automatic detection of beginig of reserve cylinder use

Telemetry Solution to Bottled Gas

This solution is the most adequate and efficient system designed to detect the switch from an empty bottle to a reserve cylinder.

The telemetry system notifies the gas company when full bottles are needed, enabling a considerable drop in logistics costs, as it avoids unnecessary trips to the site.

Furthermore, various value-added services are at hand with the end customer safety in mind, such as intrusion detectors.
